### Whitmer's Electric Vehicle Nirvana

We are rushing headlong into a world where everyone has an EV that will be affordable to everyone as soon as we get rid of the "CLIMATE DESTROYING" gas guzzling fossil fuel pollution generators.

By then, just maybe, we can stop the demise of our planet before our 10 year expiration date comes due. Governor Whitmer and her new world order cronies are in lock step to move us to where we never have to leave our new inner city "diverse planned communities" where we can eat bugs because meat produces too much methane, that also destroys the plant.

Whitmer wants to reach her new EV goal of 2,000,000 vehicles by 2030, it should be reachable because she is almost there right now with a current EV count of 17,500 out of 8.7 million vehicles that are on the road. In her world she envisions "electrified roads" that will drive your car and charge it for you, how could that go wrong? The only problem is that she doesn't know how they are going to pay for it. Never fear Uncle Sam can print some more money to cover it.

The only problem is that it won't happen because people don't want EV vehicles they can't afford. Right now the government is bribing you by giving rebates so you can afford to buy them, but not a lot of people are biting. You have to ask how long is the government going to be spending taxpayer dollars to get you to buy an EV you don't want?

Another bonus for the "Greta Thunberg" acolytes is the inevitable needed for the "home charging station" they will need to keep their EV ready to go. The good news is that you won't need to go to those nasty gas stations that are causing all of our environmental problems. To get started you will need to pony up enough money to be able to charge your "clean energy EV" so you can use it the next day. The startup cost for a fast charger will only run you between \$2,000 and \$4,000. Now that the start up costs have been covered all you need to do is plug your EV in and you are good to go -- Oh I forgot to tell you that you have to pay for the electricity you will need to charge your EV that is being generated by Coal and Gas powered energy sources. Never fear we are getting rid of those nasty polluting forms of energy by 2030. AS our backup we have the windmills and solar farms that are popping up everywhere. Trust us they have that covered and they shouldn't have any problem providing the energy needed to meet all of our energy demands. Don't worry about the brown outs and the higher energy costs that's just the price you have to pay to save the planet.

The good news is you won't have to take those long road trips anymore. Those days are over!

Welcome to Whitmer's world -- and don't forget your pronouns!
